

**CLAIM AMENDMENTS**

1. - 7. (Canceled)

8. (Previously Presented) Telecommunications apparatus, comprising:

a base unit including an interface to a telecommunications network;

at least one wireless remote microphone in wireless communication with the base unit, enabling a user of the microphone to speak to a listener through the base unit and telecommunications network,

the base unit forming part of a video teleconferencing system including a video camera for capturing images of the user for transmission to the listener through the telecommunications network;

a wireless locator signal transmitter located at the base unit;

the remote microphone being configured to receive and re-transmit the locator signal to the base unit, enabling the base unit to determine a positional aspect of the user of the microphone; and

a pan or tilt capability associated with the video camera which is controlled as a function of the positional aspect, enabling the video camera to visually track a moving user.

9. - 10. (Canceled)

11. (Currently Amended) The telecommunications apparatus of claim [[9]] 8, further including:

an auto-focusing capability for the video camera which is controlled as a function of the positional aspect.

12. (Currently Amended) The telecommunications apparatus of claim [[9]] 8, further including:

a zoom lens associated with the video camera which is controlled as a function of the positional aspect.

13. (Previously Presented) The telecommunications apparatus of claim 8, further including:  
a plurality of wireless remote microphones, each re-transmitting the locator signal to the base unit; and

circuitry for distinguishing the signals received by each microphone so that the camera tracks a particular user when that user is speaking.

14. (Previously Presented) The telecommunications apparatus of claim 13, further including:  
a plurality of wireless locator signal transmitters; and  
wherein each remote microphone re-transmits one of the locator signals to the base unit, enabling the base unit to determine a positional aspect of each user.

15. (Previously Presented) The telecommunications apparatus of claim 14, further including:  
a pan, tilt, or zoom capability associated with the video camera which is controlled as function of the positional aspect of each user.

16. (Previously Presented) The telecommunications apparatus of claim 15, wherein the pan, tilt, or zoom capabilities are effectuated by selecting a subset of pixels from a larger number of pixels in an image gathered by the camera.

17. (Previously Presented) The telecommunications apparatus of claim 14, further including:  
an auto-focusing capability for the video camera which is controlled as a function of the positional aspect of each user, enabling the camera to control depth-of-field associated with one or more users.

18. (Previously Presented) The telecommunications apparatus of claim 8, wherein the wireless signal transmitter located at the base unit transmits an inaudible acoustic signal.

19. (Previously Presented) The telecommunications apparatus of claim 13, wherein the circuitry for distinguishing the signals received by each microphone so that the camera follows a particular user includes a different carrier frequency associated with each microphone.

20. (Previously Presented) The telecommunications apparatus of claim 13, wherein the circuitry for distinguishing the signals received by each microphone includes microphone identification circuitry located at the base unit.

21. (Previously Presented) The telecommunications apparatus of claim 8, further including circuitry for:

evaluating signal quality from the microphone; and

activating an alarm if the signal quality indicates that the microphone is being carried away by the user.
